* Natural crude oil only.

** Data are not available for any component of the Sino-Soviet Bloc on which to base an estimate of the quantity of secondary aluminum used each year. Secondary aluminum is defined as consisting only of old scrap and does not include industry scrap or run-around scrap, which is considered part of inventory stocks. Among the factors on which the amount of old scrap used each year by the aluminum industry depends are the length of time that the metal has been in common use in the country, the relationships between cost and price of both primary aluminum and old scrap, and the rate of obsolescence of finished goods made from aluminum.
